KME, the world's largest manufacturer of copper rolled products together with Euramax, true specialist in coil coating, and Beckers, expert in coatings, have combined their expertise and developed an innovative pre-coated copper surface.

Copper is a precious material. The reddish-brown coloured surface is treasured by architects, manufacturers and installers worldwide. Bright rolled copper, beautiful right from the outset, will display the amazing weathering effects over time. These natural effects are often appreciated, but not always intended by the end-user. Especially interior designers have often asked for a longer lasting bright copper surface.

Now a solution highly recommended for façade cladding, roofing and interior applications is available.

Pre-coated copper

Surface change caused by oxidation can be stopped for a long period of time by pre-coating the material. This protective coating highlights the natural beauty of the original copper, giving it more depth and shine.

The product

TECU® Classic copper in various thicknesses, provided with a 2-layer Fluoropolymer coating system.

The advantages

- Preservation of the original copper look
- More depth and copper shine
- Graffiti resistant
- Easy to clean
- High UV-resistance
- High chemical resistance
- Good flexibility for bending and roll-forming
